Please change page 59 (the "Abstract" page) to read thus:

ABSTRACT

1       Ramps are printed with ink of a particular color, and also  
2       nominally in that color but by inks of other colors. A measured  
3       actual-ink ramp is a standard to fix the other-colors ramp, and  
4       correct other printing in those colors. In one aspect a partic-  
5       ular color is gray, actual ink black (K), and other-color inks  
6       magenta (M), yellow (Y) and cyan (C). In another aspect, actual  
7       ink is red (R), green (G) or blue (B); other colors M, Y and C  
8       in respective pairs. For gray/black, the K ramp is a zero-chro-  
9       ma standard to lower composite-black (cK) chroma below  $\sim 2.5 \Delta E$ .  
10      A sampling aspect prints for each gray tone plural cK-ink  
11      combinations preferably bracketing nominal gray values; and  
12      searches these for one nearest the particular gray — or most  
13      closely bracketing it, for interpolation — for best match.  
14      Bracketing is best optimized, by a color-space pattern centered  
15      on nominal. Other aspects are taught.
